The full picture.

A walk-through of Fit4Academy at Phase 5 — the native iOS & Android product, plus the SaaS your gym owners use to run everything.

FOR OWNERS

Run the front desk, payments, classes, members, and message threads — all in one screen.

FOR STUDENTS

Check in by walking up to the gym, pay, message your coach, track your belt — all in one app.

FOR THE BRAND

Mint Green and Slate, Space Grotesk for headlines, DM Sans for everything else.

BRAND ESSENTIALS

A precise, calm, premium brand.

Fit4Academy speaks softly and shows up sharply. Mint Green for action and confirmation, Slate for everything else, Space Grotesk for numbers that should feel proud, DM Sans for the words that stay out of the way.

PRIMARY PALETTE

TYPOGRAPHY

DISPLAY — **Train. Track. Get better.**

H1 — **Run your academy. Not your spreadsheets.**

BODY — For paragraphs, labels, and forms. Avoids drama. Reads on a phone in 4G.

NUMBERS — **$12,480 · 248 members · 19 today**

VOICE

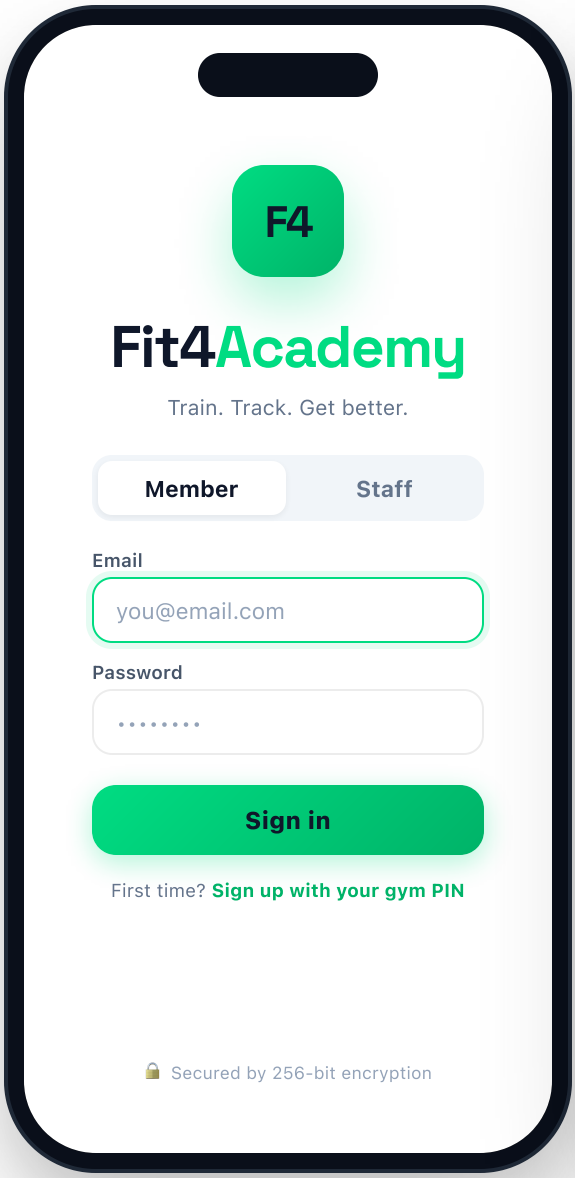
What we sound like. Direct. Specific. Quietly confident. We talk to gym owners like a peer who's been on the mats — not a marketer.

What we don't. No "supercharge", no "revolutionary", no "10x". No exclamation marks unless they're earned.

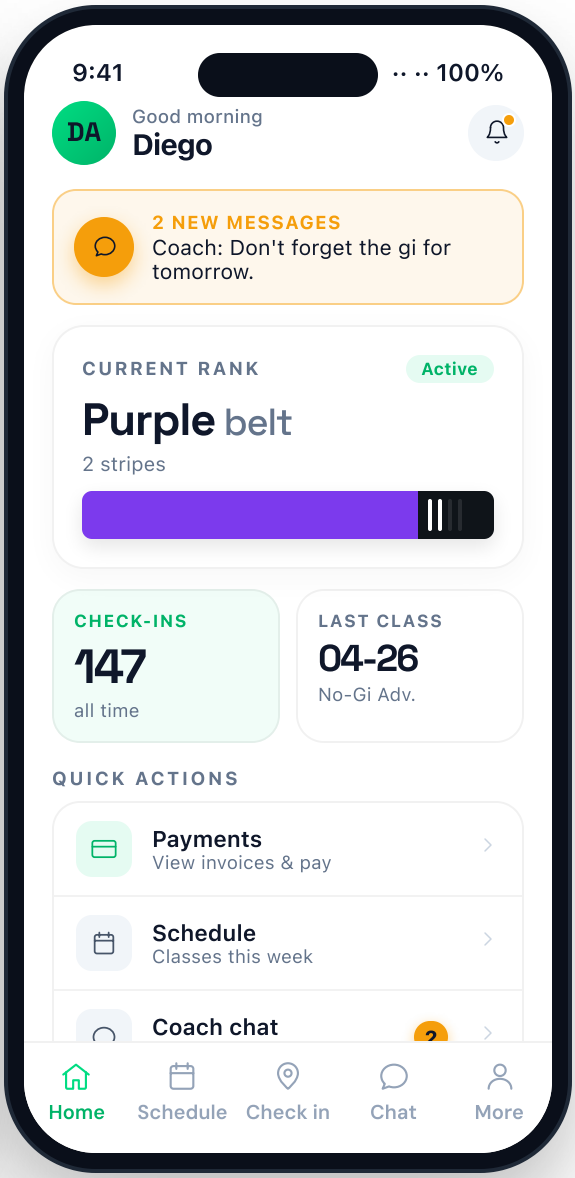
FOR STUDENTS

An app that knows when they arrive at the gym.

Members open the app once, sign up with the gym's PIN, and from then on every interaction is one tap or one face-scan: walk up to the door and check in, see today's class, message the coach, pay the monthly with Apple Pay. Native iOS and Android in Phase 5 unlock the proximity push, biometric confirmation, and Live Activities below.



Sign in
Member & staff modes share a single screen. The first-time sign-up uses the per-member PIN that staff hands out.

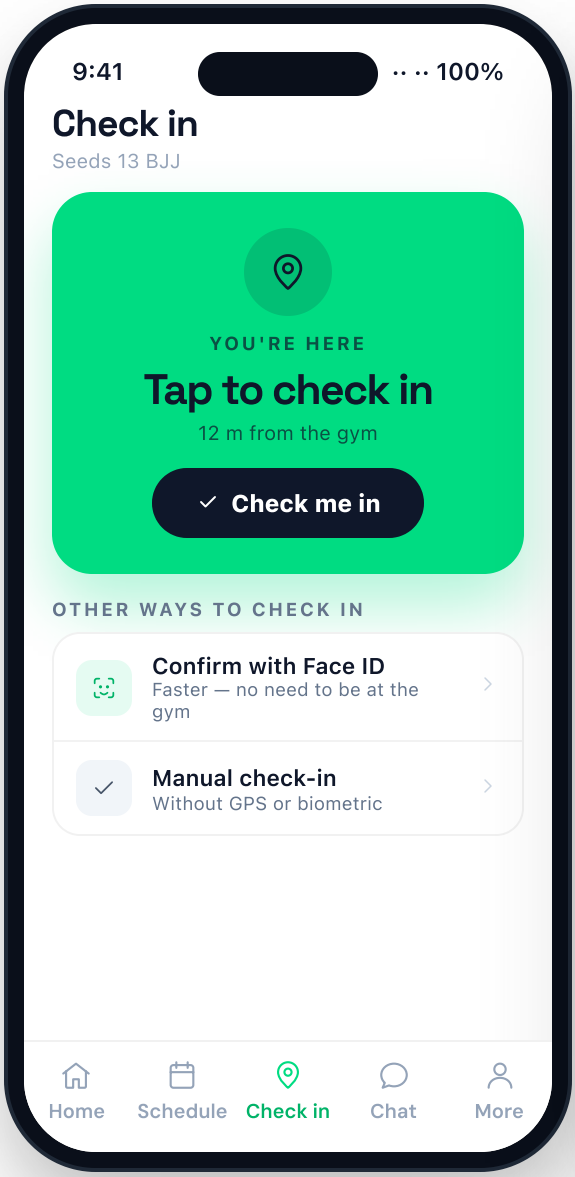


Home
Time-aware greeting, real belt graphic with stripes, the unread coach-message banner if any, and the four most-used actions one tap away.

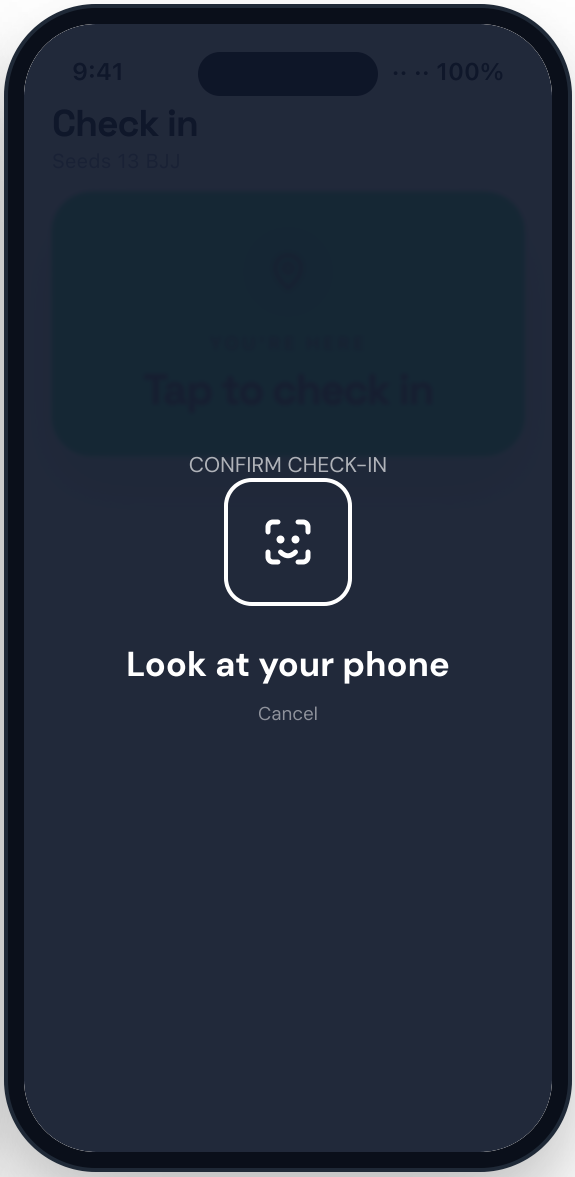
PHASE 5 — NATIVE

Walk up. Get checked in.

When the phone's GPS or BLE sees the gym within 50 m, the screen flips to the mint hero. One tap and the check-in lands on the front desk's dashboard. For when GPS isn't sure, Face ID is one row away.



In-range hero
The whole screen becomes the action. Out-of-range it shows the meter count instead of the button.

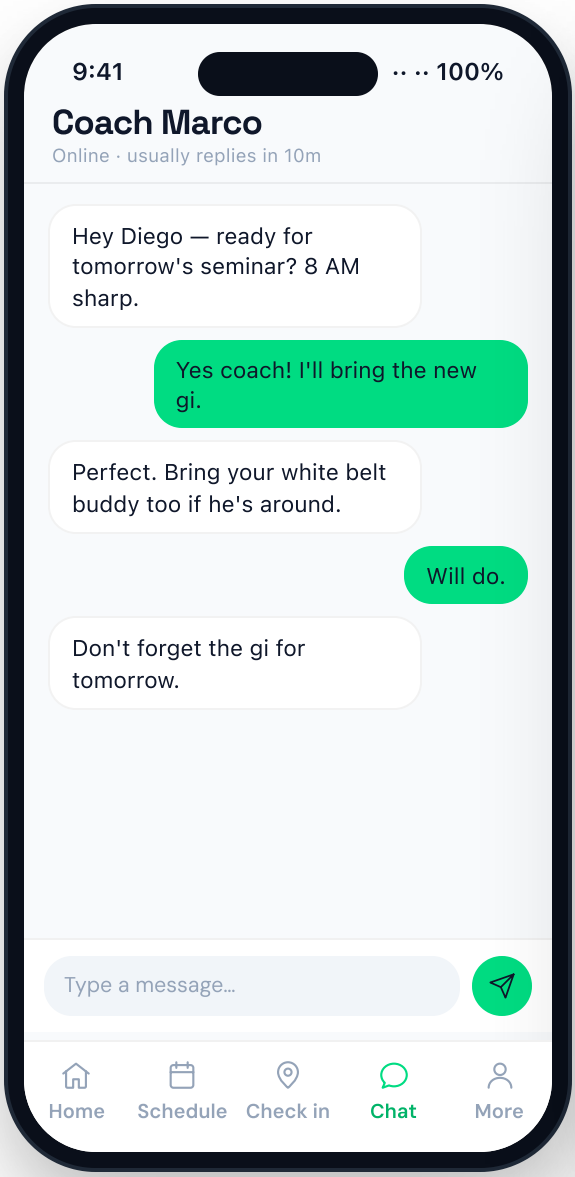


Face ID confirm
Native iOS sheet — no third-party password, no forgotten PIN. Available only in the native build.

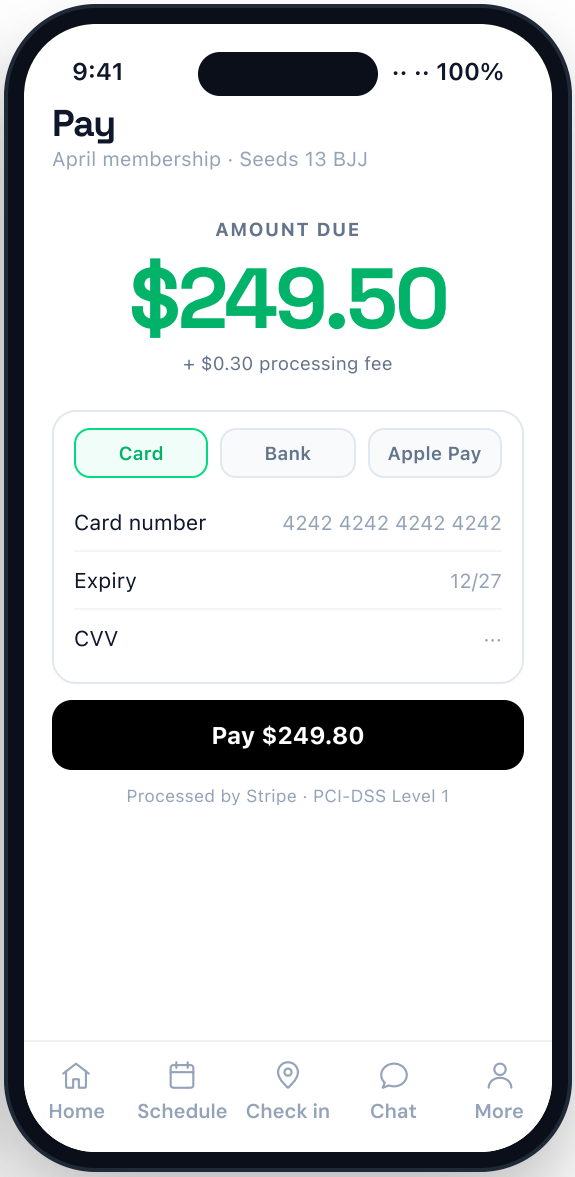
DAILY USE

Conversations and payments, side by side.

Coaches and members message each other in a single thread per member. Stripe runs the payments — cards, ACH, Apple Pay, Google Pay — never touching our servers.



Coach chat
One thread per member. Push notifications fire on iOS 16.4+ once the PWA is installed (Phase 1) or always in the native build (Phase 5).

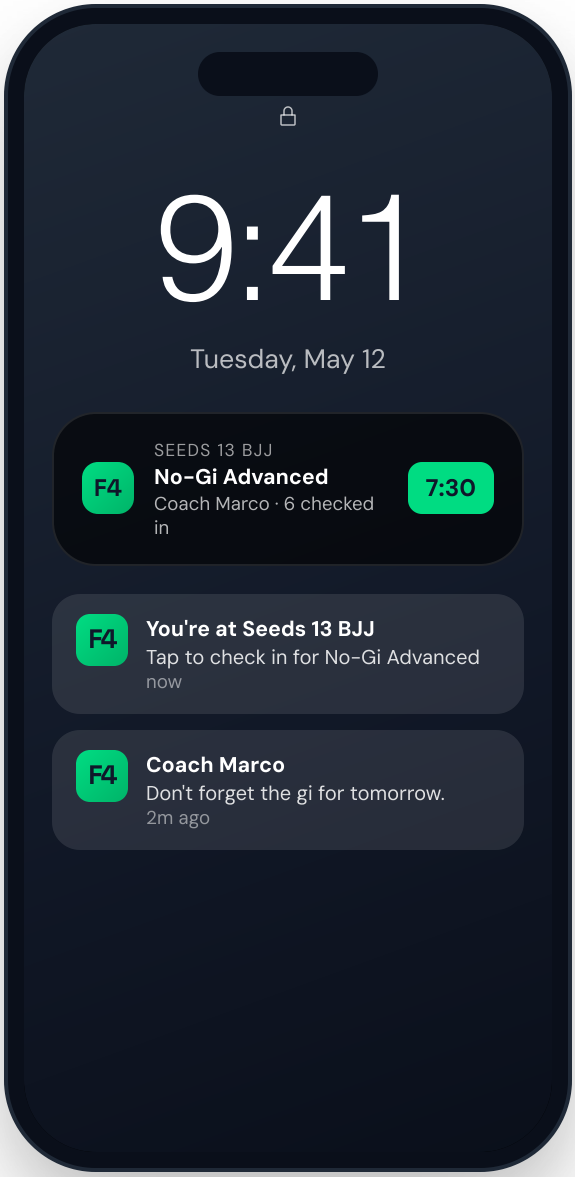


Payment
Stripe Payment Element handles cards, ACH and Apple Pay. The native build adds the iOS sheet over the web embed for a tighter feel.

NATIVE-ONLY

Showing up where the member already is.

Two things only the native app does. A geofence push that lands on the lock screen the moment the member is within 50 m of the gym, and a Live Activity that pins the next class to the dynamic island and lock screen for the hour before it starts.



Geofence push + Live Activity
The PWA cannot run in background — these two surfaces require the native build. Right at the top of the lock screen, the timer ticks down to "No-Gi Advanced" with the coach's name; below it, the proximity push asks for one tap to check in.

Why these matter

Members arriving at the gym don't open the app — their phone is in their pocket. The proximity push is the cue to check in. The Live Activity is the cue to leave home on time.

Both translate to retention numbers: students who check in consistently train more weeks per year, and gym owners who can see check-in rate per student catch dropoffs early.

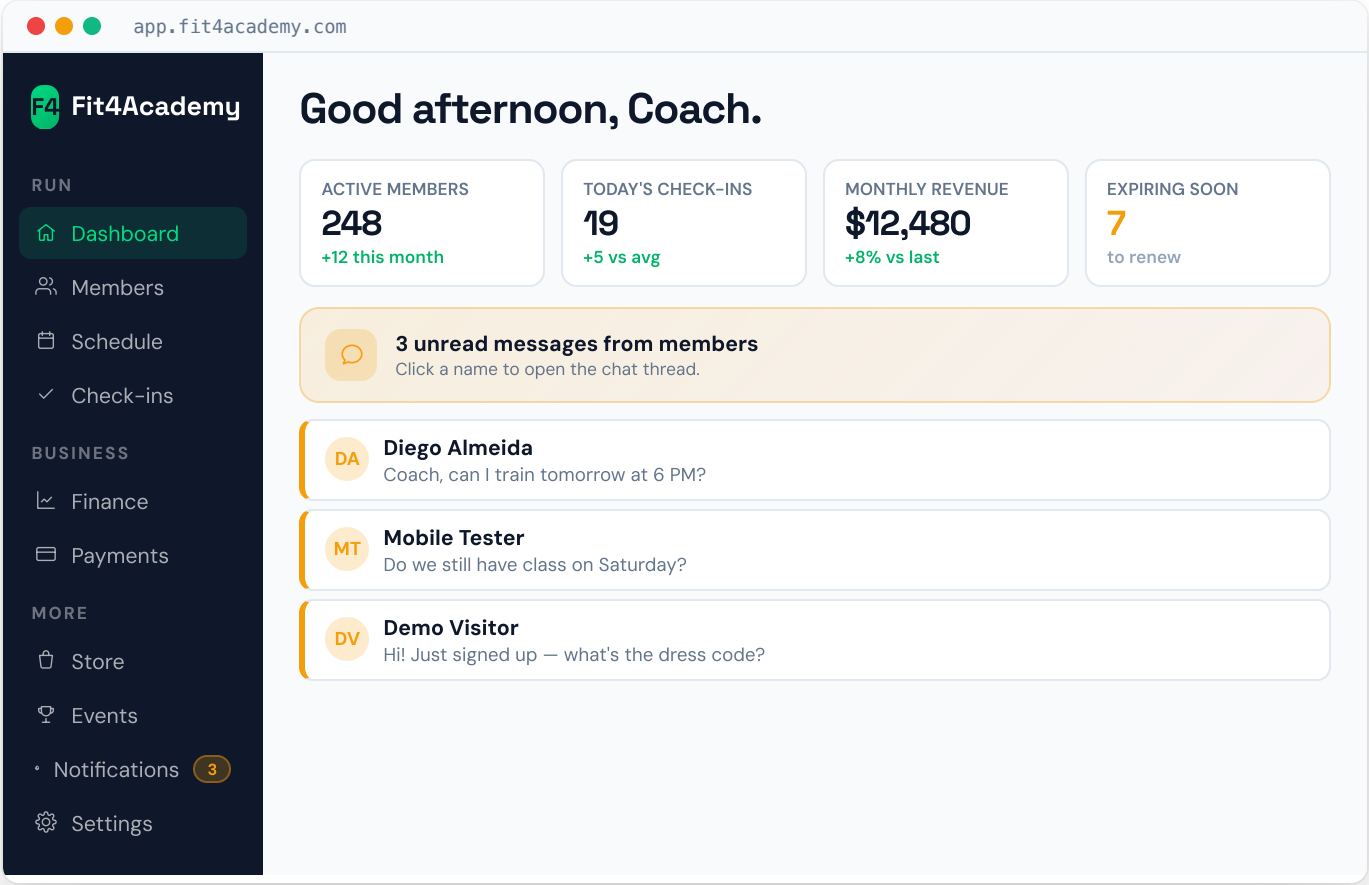
Built on

expo-location significant-changes API, Apple Push Notification Service, ActivityKit, and the ARN topic our backend already knows how to address.

FOR GYM OWNERS

One screen to run the whole academy.

The SaaS side is desktop-first because that's where front-desk and ownership work happens. Login lands directly on the dashboard — KPIs, today's classes, a banner for unread messages from members, and one-click triage for everything that needs attention.

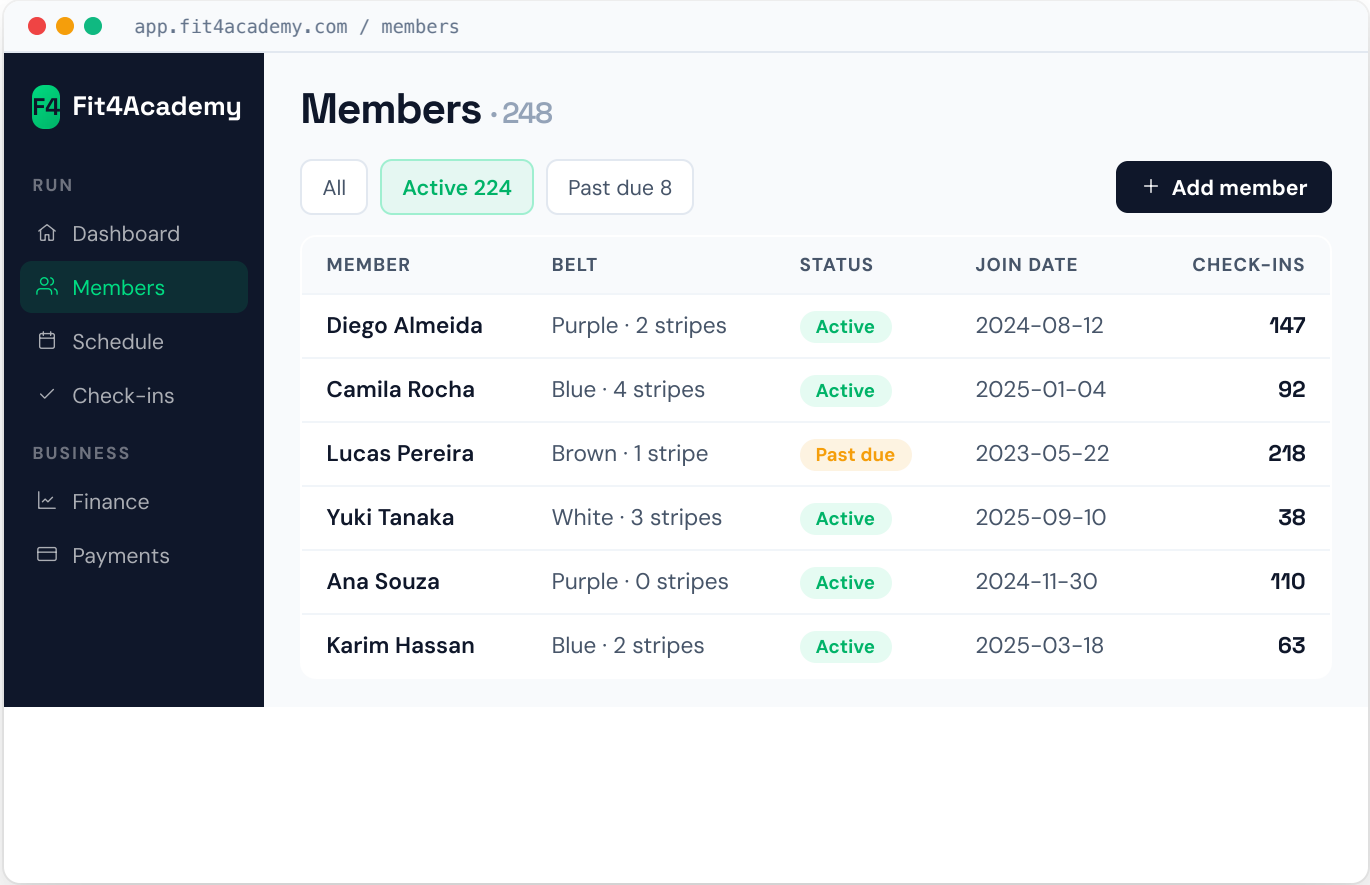


Dashboard — the orange banner at the top is new in this version: it surfaces unread member messages straight on the home page so a coach who logs in sees them before clicking around.

MEMBER ROSTER

Every member, one filterable list.

A coach answering "who's past due this month" or "how many purple belts do we have" finds the answer in two clicks. Filters at the top, table below, and the action buttons stay in the same place across every list.

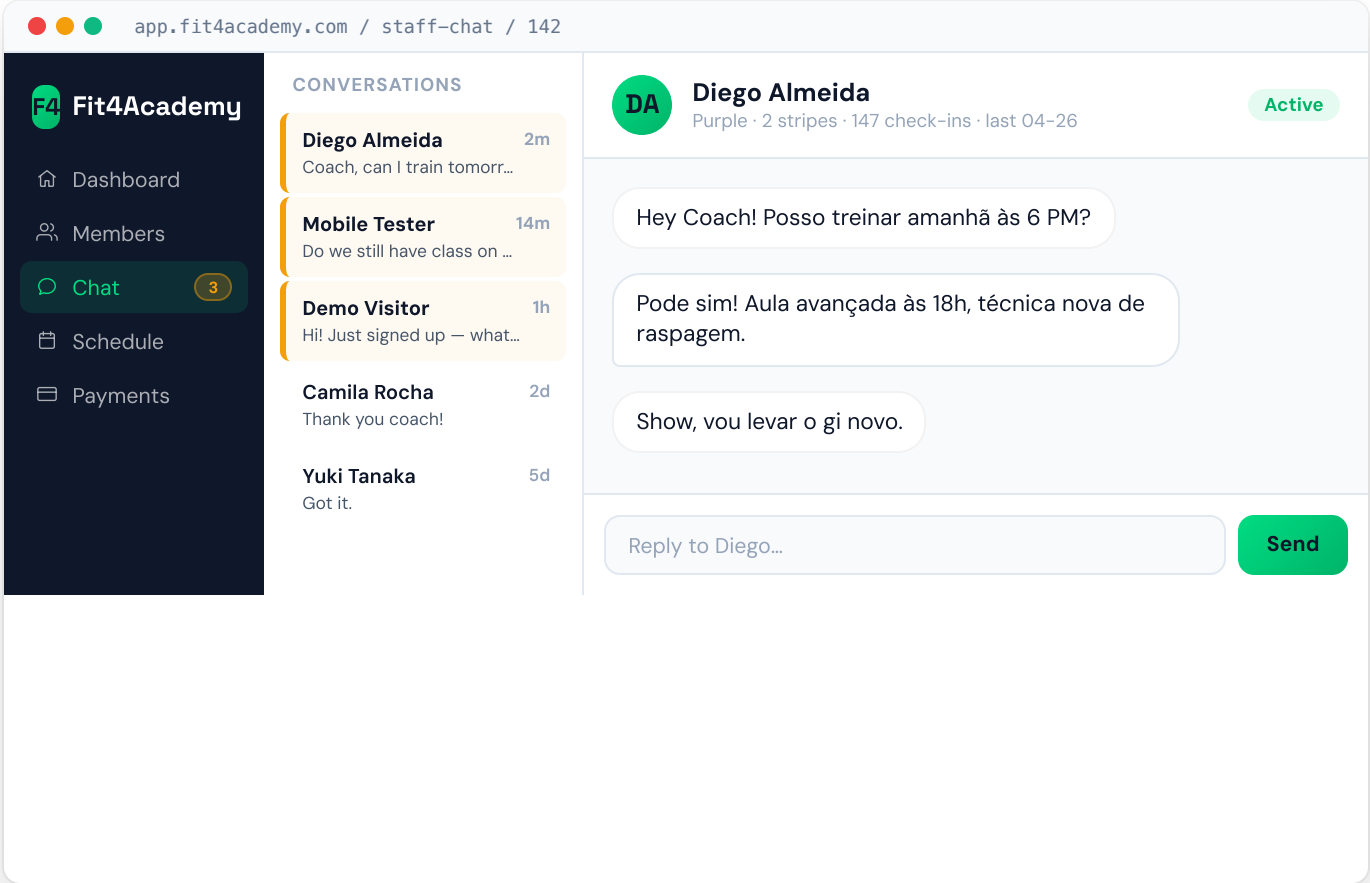


Members list — past-due rows are tagged amber so the coach can settle outstanding balances before class. Belt + stripe live next to the name to nudge promotion conversations.

REPLYING TO A STUDENT

Same chat. Same data. Two views.

When the coach clicks a member from the orange banner on the dashboard, they land here. The conversation is the same one the member sees in the iPhone app — sent through the same JWT-protected endpoints — just rendered desktop-first.



Single chat thread — typing indicator, member context (belt, last check-in, pending balance) on the right rail, full history scrolled to the latest unread.

WHERE WE ARE

Five phases. PWA in production today.

Phase 0–1 are live in production at `web-production-83f27.up.railway.app/app/`. Phase 2 is mid-flight — chat, payments, and dashboards are working; push and the in-app store are next. Phases 4–5 unlock the native-only features shown in this deck.

0 — DONE
Foundation
JWT auth, member & staff API, mobile scaffold, login + signup screens.

1 — DONE
PWA beta
Expo web export served at /app/. iPhone "Add to Home Screen" works; install prompt embedded.

2 — IN PROGRESS
Member features
Dashboard, payments (PCI-fixed), chat with unread badges, schedule. Push notifications next.

3 — NEXT
Owner features
KPIs, members table, today's classes, manual payment flow, quick check-in for the front desk.

4·5 — PHASE 5
Native publish
App Store + Play Store. Unlocks geofence-arrival push, biometric confirm, BLE beacon check-in, Live Activities, Apple Pay native sheet.

Trigger to ship the native build

Phase 5 is gated on market signal, not time. We move when one of these fires:

- 5+ academies paying a recurring subscription (validation of demand)
- A top-3 gym owner says "I'd buy if you had geofence-arrival push" (validation of feature as the wedge)
- Apple or Google changes a rule that breaks something we rely on in the PWA

PHASE 5 PRODUCT VISION

Run your academy.
Not your spreadsheets.

Owners stop juggling WhatsApp groups, paper sign-in sheets, and spreadsheets. Members stop wondering if their belt is logged or if their payment cleared. Both sides know — exactly, in real time — what's going on.
